

The Ultra Sonic Facial ,What does it do?

What is an Ultrasonic Facial?

An ultrasonic facial treatment is an aesthetic device that uses sound waves to boost circulation in the skin and stimulate the protein that gives skin its elasticity and firmness. The Ultrasonic Facial is a gentle, non-invasive treatment that is safe for all skin types and conditions, from acne or rosacea to mature skin. Ultrasound waves penetrate the skin to cleanse, hydrate, increase circulation, promote collagen production, and kill bacteria. Even the most sensitive skin will benefit from this treatment.

What does an Ultrasonic Facial Do?

Ultrasound waves penetrate the skin to deeply cleanse, exfoliate and kill bacteria. These vibrations thoroughly loosen and gently lift dead surface skin cells and debris from hair follicles allowing a deep cleaning within the skin pores and exfoliating without irritation. The skin feels immediately smoother and softer.

The Ultrasonic Facial also promotes cellular renewal and repair, collagen reproduction, toning of facial muscles, increased blood circulation, encouraging lymphatic drainage, combating puffiness and swelling and improving the absorption of skin care product penetration making the process highly effective, with no downtime, redness or pain.

Results are gradual and can vary by individual and skin type and will not just occur over night. Although Ultrasonic treatment has been shown to produce an immediate and temporary firming effect, a series of 4-6 treatments will provide more cumulative long-term, lasting results.

### The Deep Cleanse Treatment

The Deep Cleanse treatment uses water or facial toner with continuous waves to remove dead cells from the surface of the skin. By applying the tip of the blade to the facial area it is able to deliver a wave of vibrations to give a targeted deep cleanse without irritation leaving your skin feeling refreshed, rejuvenated and ultra smooth. This process of deep cleansing and exfoliation expels pollutants, dirt and grime trapped in the epidermis and helps to clean out acne and it won't sensitize the skin during the process. The deep cleaning treatment is able to deliver a targeted cleanse leaving our skin feeling refreshed, rejuvenated and ultra smooth.

### The Sonophoresis treatment

The Sonophoresis treatment uses Pulsing Waves to increase the permeability of your skin, this application helps to achieve effective absorption of facial serums. by creating temporary openings in the skin to allow the serum or other products to penetrate the epidermis more easily allowing the skin to be nourished with antioxidants and deeply moisturized. This application combined with circulation helps to plump the skin reducing the appearance of fine lines..
